

Comparing Countries - PEEL Paragraph

P - Point: Begin by stating the clear and concise comparison point.

- **Example:** "Japan and Afghanistan are very different when it comes to their fertility rates."

E - Evidence: Elaborate on the significance of the data used and the factors that contribute to the observed difference.

- **Example:** "This difference is due to several important reasons. In Japan, women often choose to focus on their education and careers, which can delay or reduce the number of children they have. The country also has excellent healthcare and social services, so families don't feel the need to have many children. However, in Afghanistan, poverty is widespread, and there is less access to education and healthcare, especially for women. Many Afghan families have larger families because cultural traditions support it, and high infant mortality rates mean parents often have more children to ensure some survive to adulthood."

E - Explain: Provide specific data or statistics to support your point.

- **Example:** "In Japan, which is a highly developed country, the average number of children a woman has is about 1.3. On the other hand, in Afghanistan, which faces many social and economic challenges, the average fertility rate is much higher at around 4.6 children per woman."

L - Link: Connect the comparison back to the main point.

- **Example:** "These differences in fertility rates have big effects. In Japan, the low birth rate is causing an aging population, which creates problems like fewer workers and economic challenges. In Afghanistan, the high birth rate adds to poverty, puts pressure on resources, and slows the country's progress, leading to social and political problems."
